

Green Infrastructure Planning for Sustainability and Resiliency

Linking Lands and Communities
in the Land-of-Sky Region

SAMAB Conference - November 18, 2010

www.linkinglands.org

Linda Giltz, AICP, Regional Planner
828-251-6622 *linda@landofsky.org*

Outline

- Intro to region
- Growth and climate change challenges
- Linking Lands and Communities project
- Designing resiliency into the Regional Network
- Planning for climate change using the LLC framework – next steps

- Multi-county, local government **planning and development** organization (Council of Governments)
- Council **board** is made up of chief elected officials from member governments, economic development representatives and others
- Council's **mission**: *to work with local governments, the Region's leadership and state and federal agencies to foster desirable social, economic, cultural and ecological conditions in Buncombe, Henderson, Madison and Transylvania Counties.*
- For more information, see www.landofsky.org

Western NC and the Land-of-Sky Region

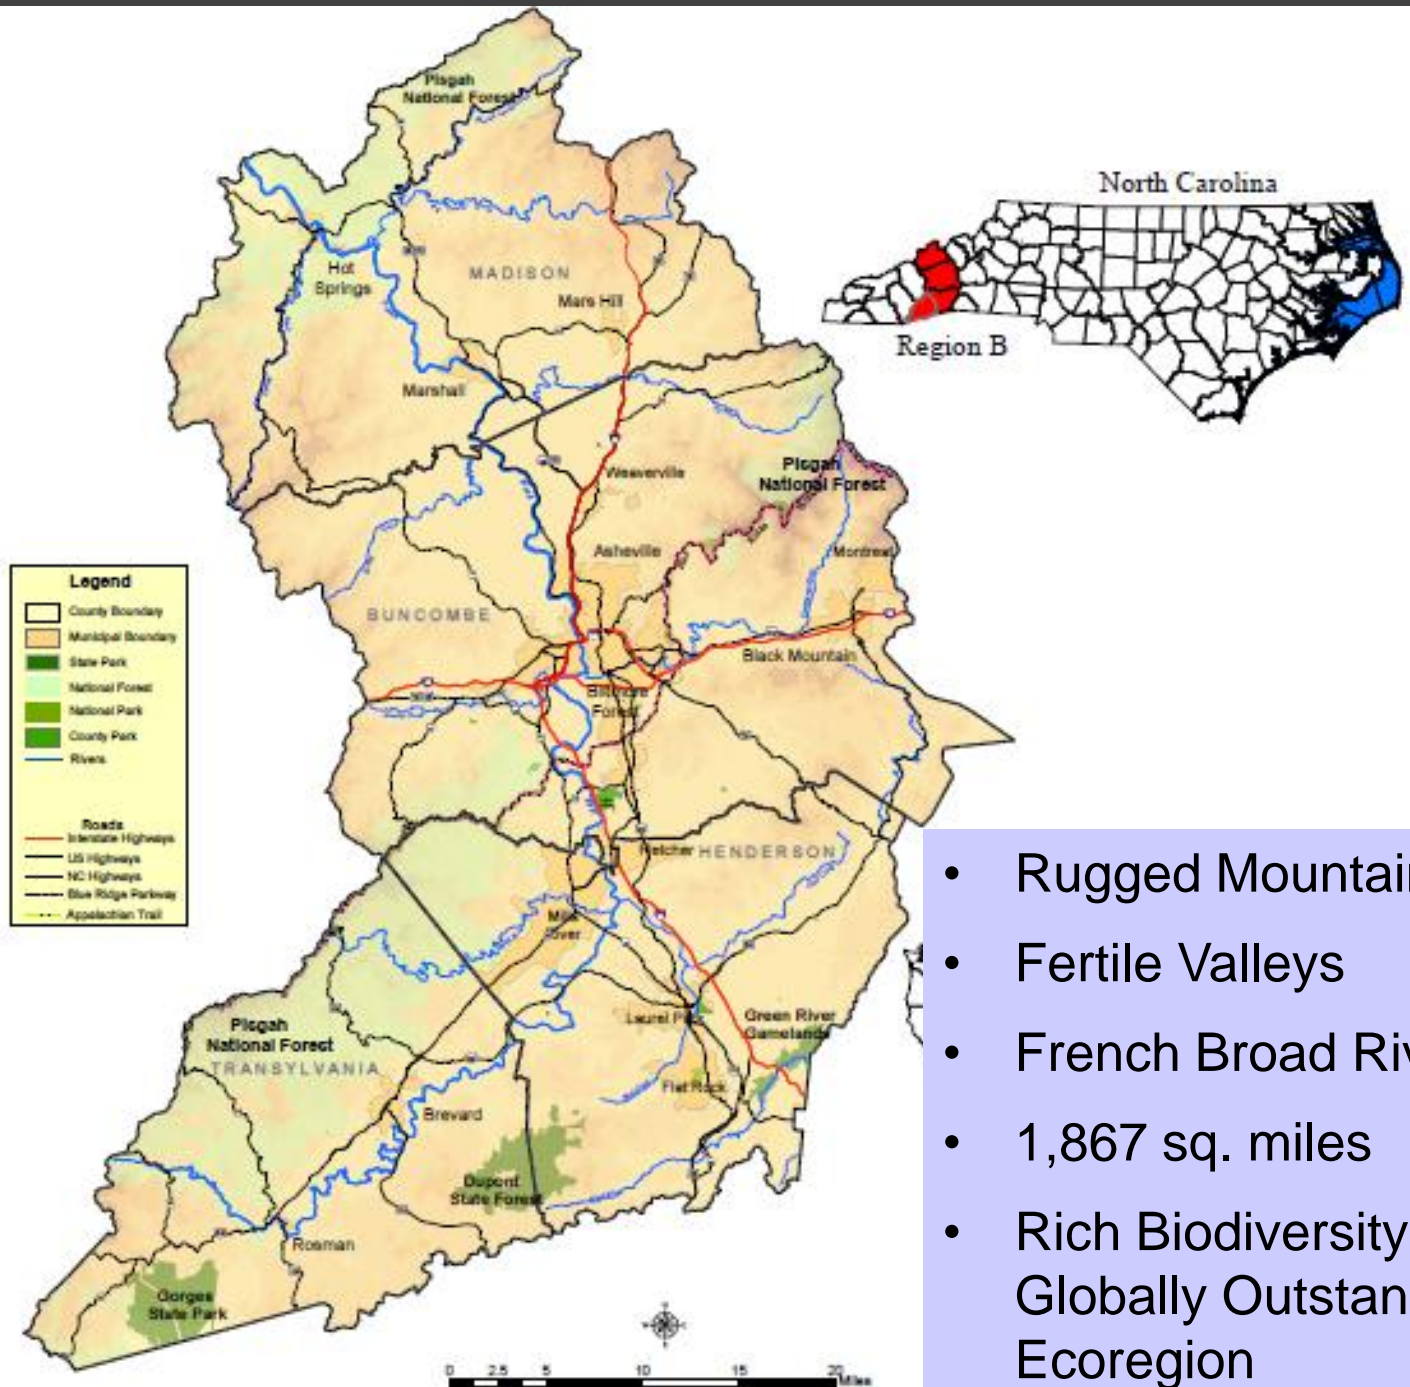

- Interstates
- Primary Rivers
- Madison County
- Region B
- Western North Carolina

This map was produced by Madison County GIS, Assessor's, Land Records, & Planning Departments.

Natural History & Resources

- Rugged Mountains
- Fertile Valleys
- French Broad River
- 1,867 sq. miles
- Rich Biodiversity – Globally Outstanding Ecoregion

Challenges Facing Our Region

*Steady population growth;
Spread-out pattern of growth*

Development on mountain ridges and steep slopes is breaking up large parcels of mostly forested land, resulting in habitat loss, loss of scenic quality, water quality issues,...

Need to preserve rich biodiversity

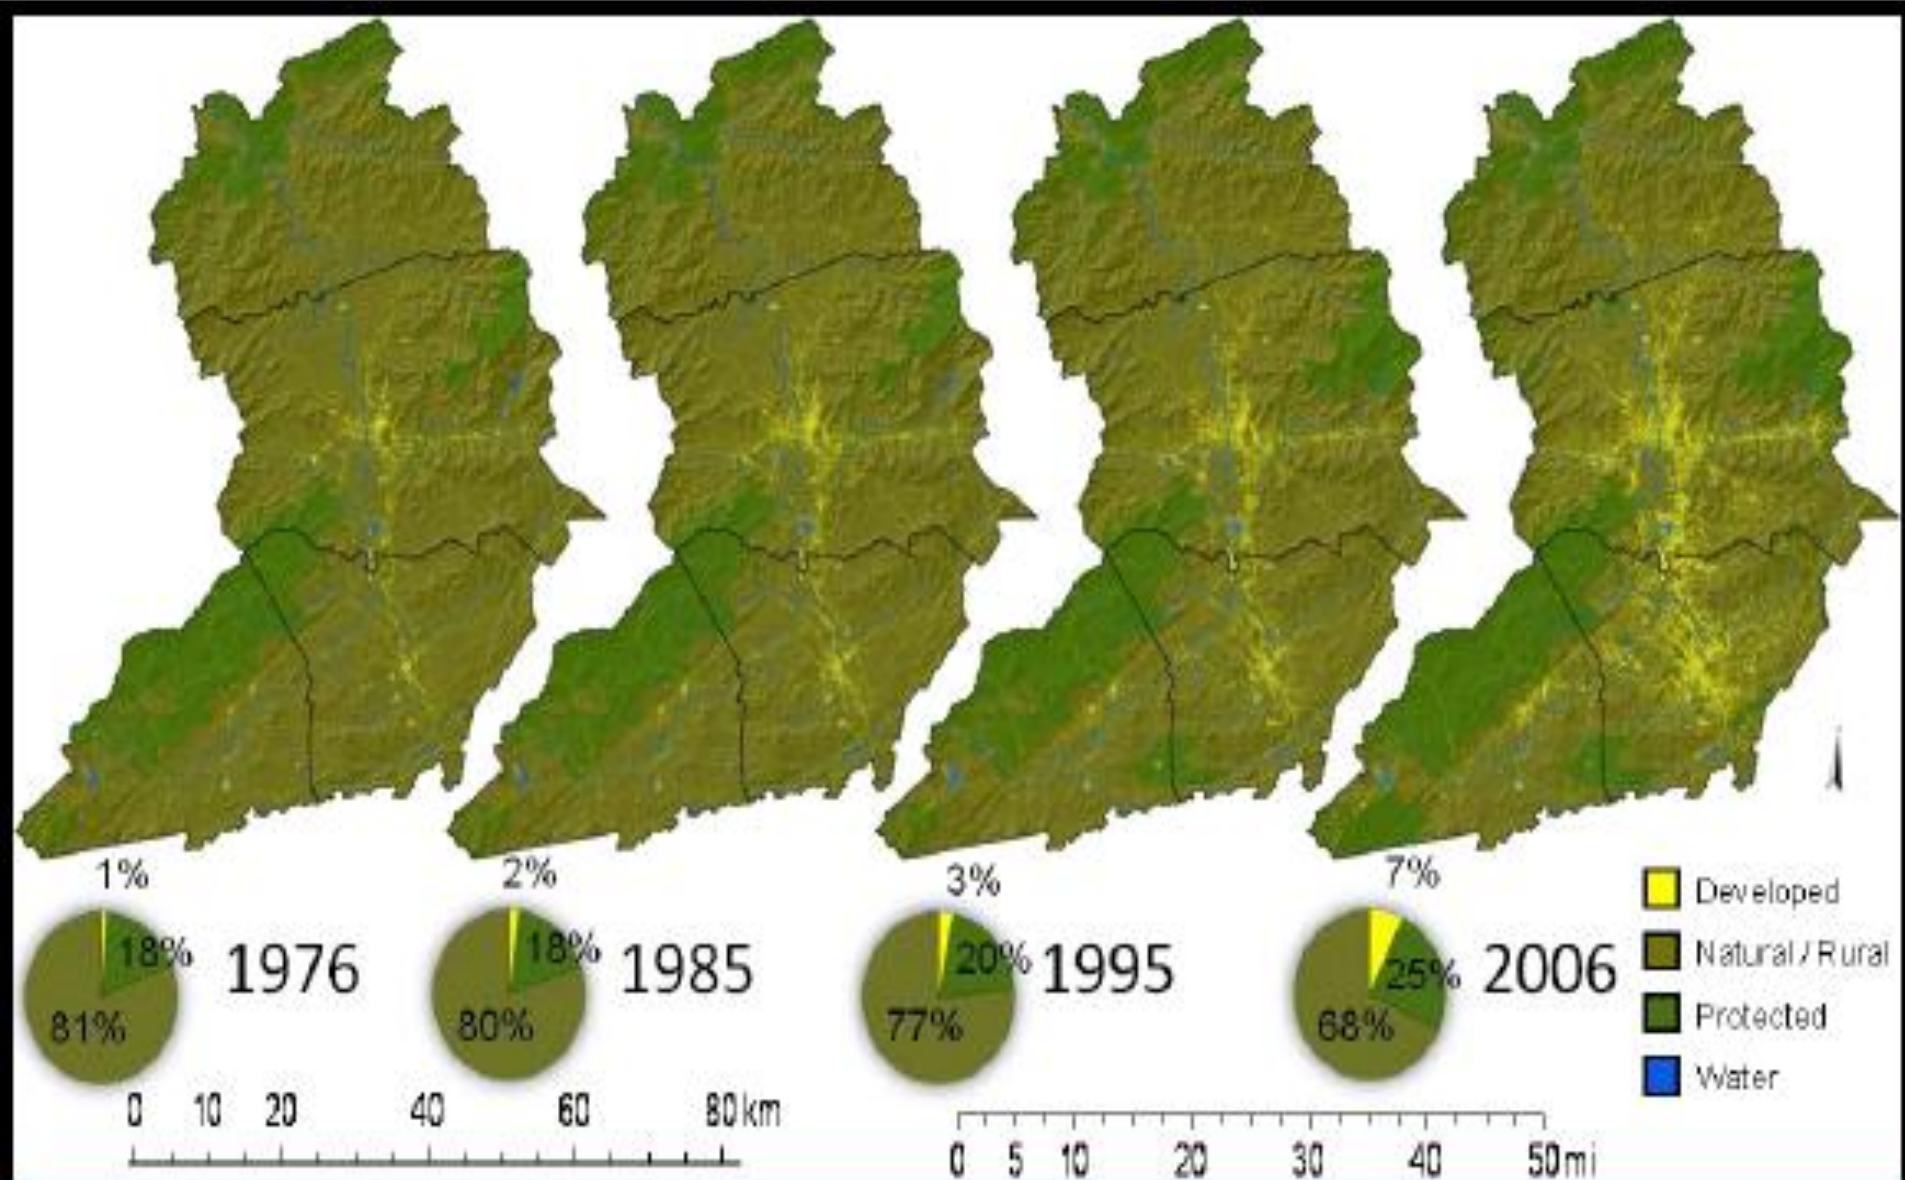

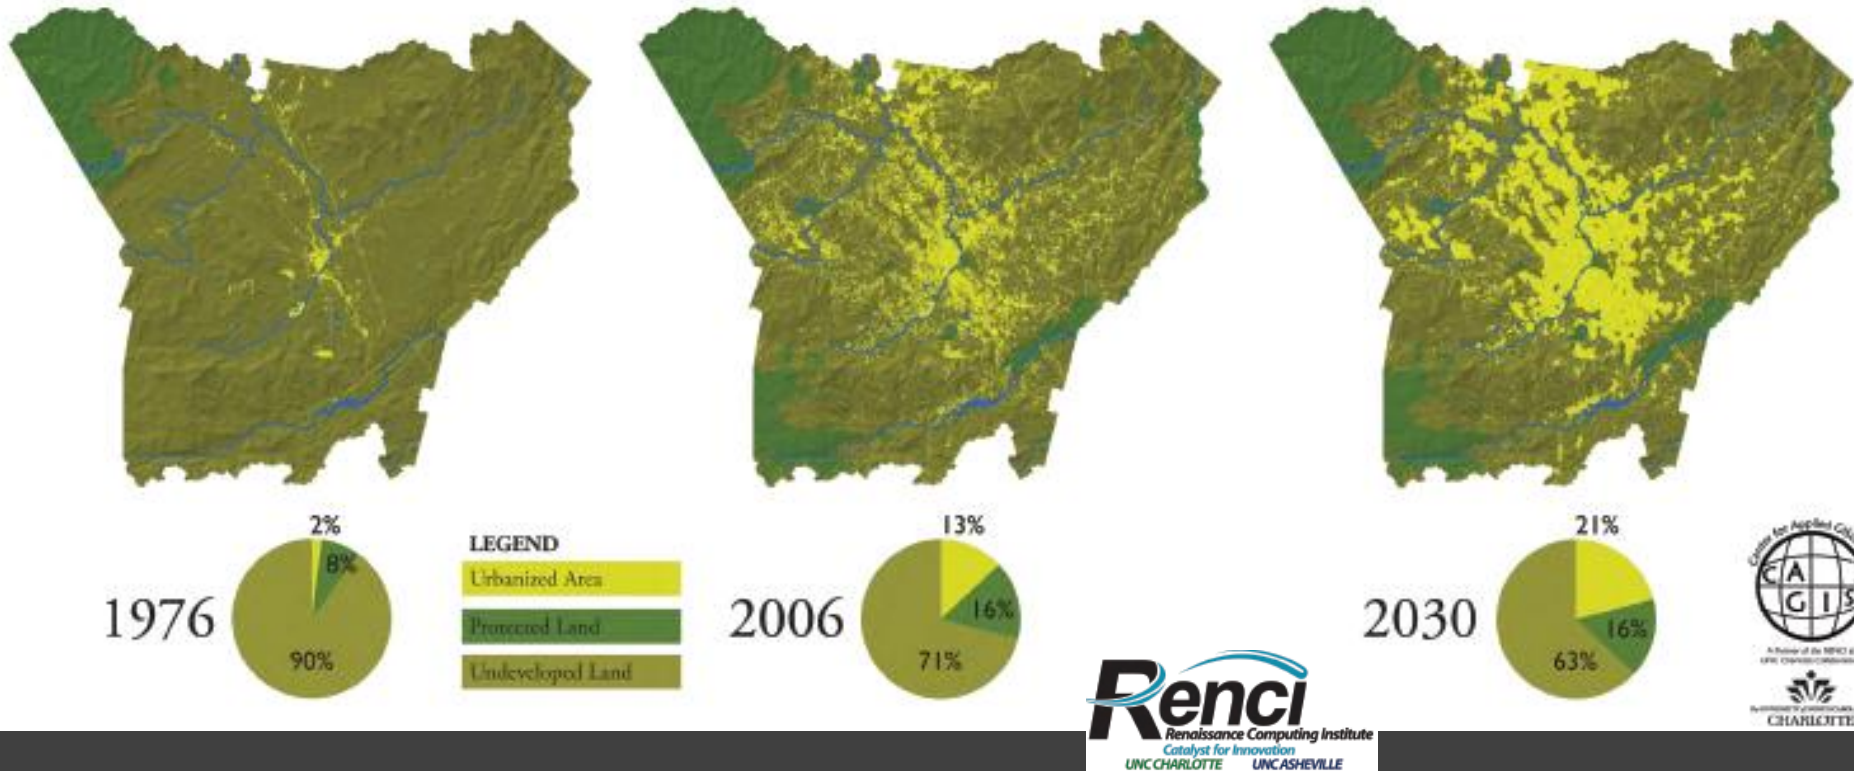

Figure 3 : Historical development patterns mapped via analysis of Landsat satellite imagery for years 1976, 1985, 1995 and 2006.

“Mapping historical development patterns and forecasting urban growth in Western North Carolina, 1976-2030.” The Center for Applied GIScience at UNC Charlotte, 2009.

How The Urban Growth Model Works

Henderson County

Satellite imagery from 1976, 1985, 1995 and 2006 used to track the advance of impervious surfaces, a key indicator of development.

Projections of development potential were constructed from statistical models using variables that help predict growth patterns: distance to roads, interchanges and urban areas; the attraction of employment centers; slope; and “pressure” from previously developed areas.

Challenges Facing our Region

- Loss of Farmland and Farming
 - *Approx. 16% of land is farmland; 86,000 acres lost between 1987 and 2007*
 - *Fragmentation into smaller parcels;*
 - *Loss of rural lifestyle and character.*
- Agriculture key to local economy and to region's resiliency

Climate Change – Expected Impacts

Water

- Flooding
- Drought
- Decreased availability

Agriculture

- Changes in crops and growing seasons
- Changes in tree species
- More loss due to fire

Humans, Communities

- Stress due to increased air and water temps
- Sever weather events
- Degraded ecosystem services

Wildlife Habitat & Biodiversity

- Changes in sizes and locations of habitat
- Species adaptation, migration or extinction

The Challenges of Growing Communities

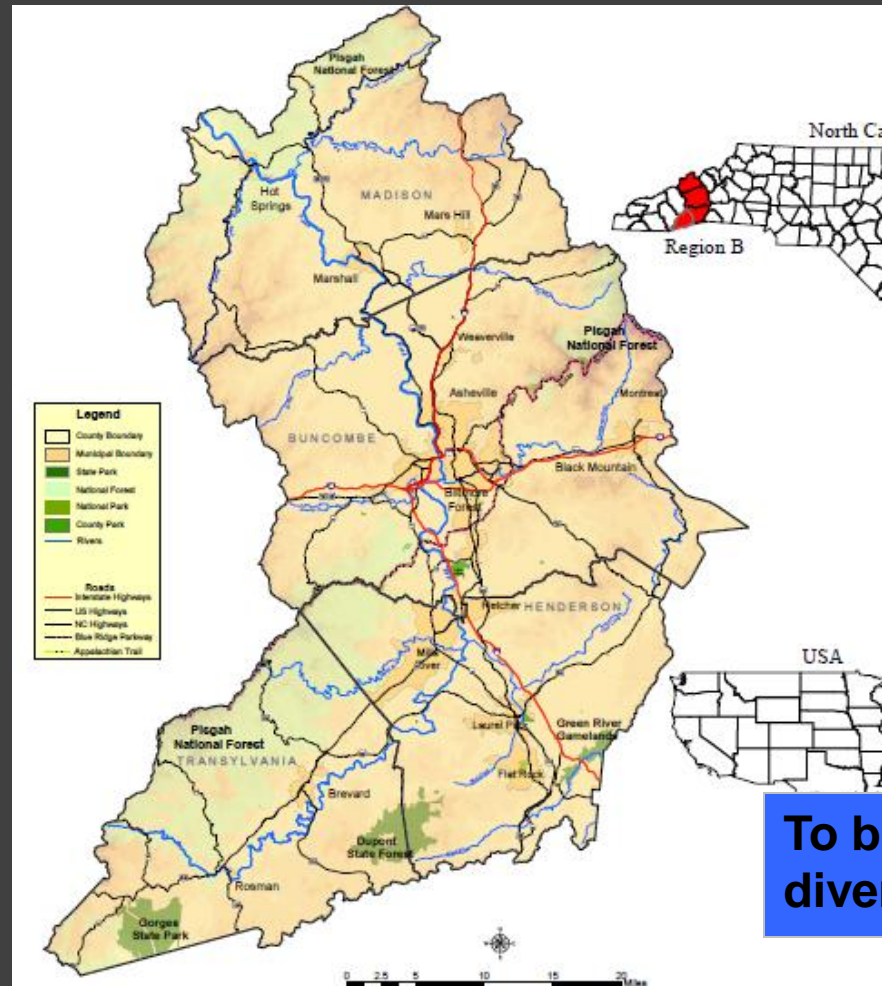

Communities need tools to make strategic and informed land use decisions

Where to encourage development?

Where to construct roads & utilities?

Which lands to conserve?

To bring together divergent interests!

Linking Lands and Communities – Goals

- *Identify where the most valuable natural resources are located and how they might be interconnected;*
- *Bring together a diverse group of organizations and individuals to explore common values and identify opportunities to work together to maintain our valued resources;*
- *Provide a set of tools and resources to help local governments and communities make more informed land use and development decisions.*

Why a Regional Network Approach?

- Nature functions as a system that does not match or respect jurisdictional boundaries
- Healthy natural systems provide valuable goods and services for the health and well-being our communities

Benefits that people obtain from healthy natural systems

- Clean water and air
- Food
- Timber
- Pollination of crops and other vegetation
- Flood and drought mitigation
- Soil formation and maintenance
- Recreation and aesthetic and spiritual benefits

Economic Benefits - Ecosystem Services

☐ Storm water management

- ✓ Lands preserved for flood storage have an 8:1 dollar savings over manmade flood control structures

☐ Supplying drinking water

- ✓ 105 of world's biggest cities rely on protected forests for drinking water (e.g. NYC - \$1.5 billion to protect watershed vs. \$6-8 billion)

HOW we are developing the network

- Using a community- and science-
based approach
- Green Infrastructure planning:
 - Is a nationally recognized collaborative method for land use planning, and
 - designed to meet the needs of ALL stakeholders.
 - is not an advocacy tool designed to favor a specific point of view
- Focus is on interconnectivity and the importance of having a network

Green Infrastructure is our region's Natural Life Support System –

an interconnected network of land and water that contributes to the health, economic well being & quality of life for communities & people.

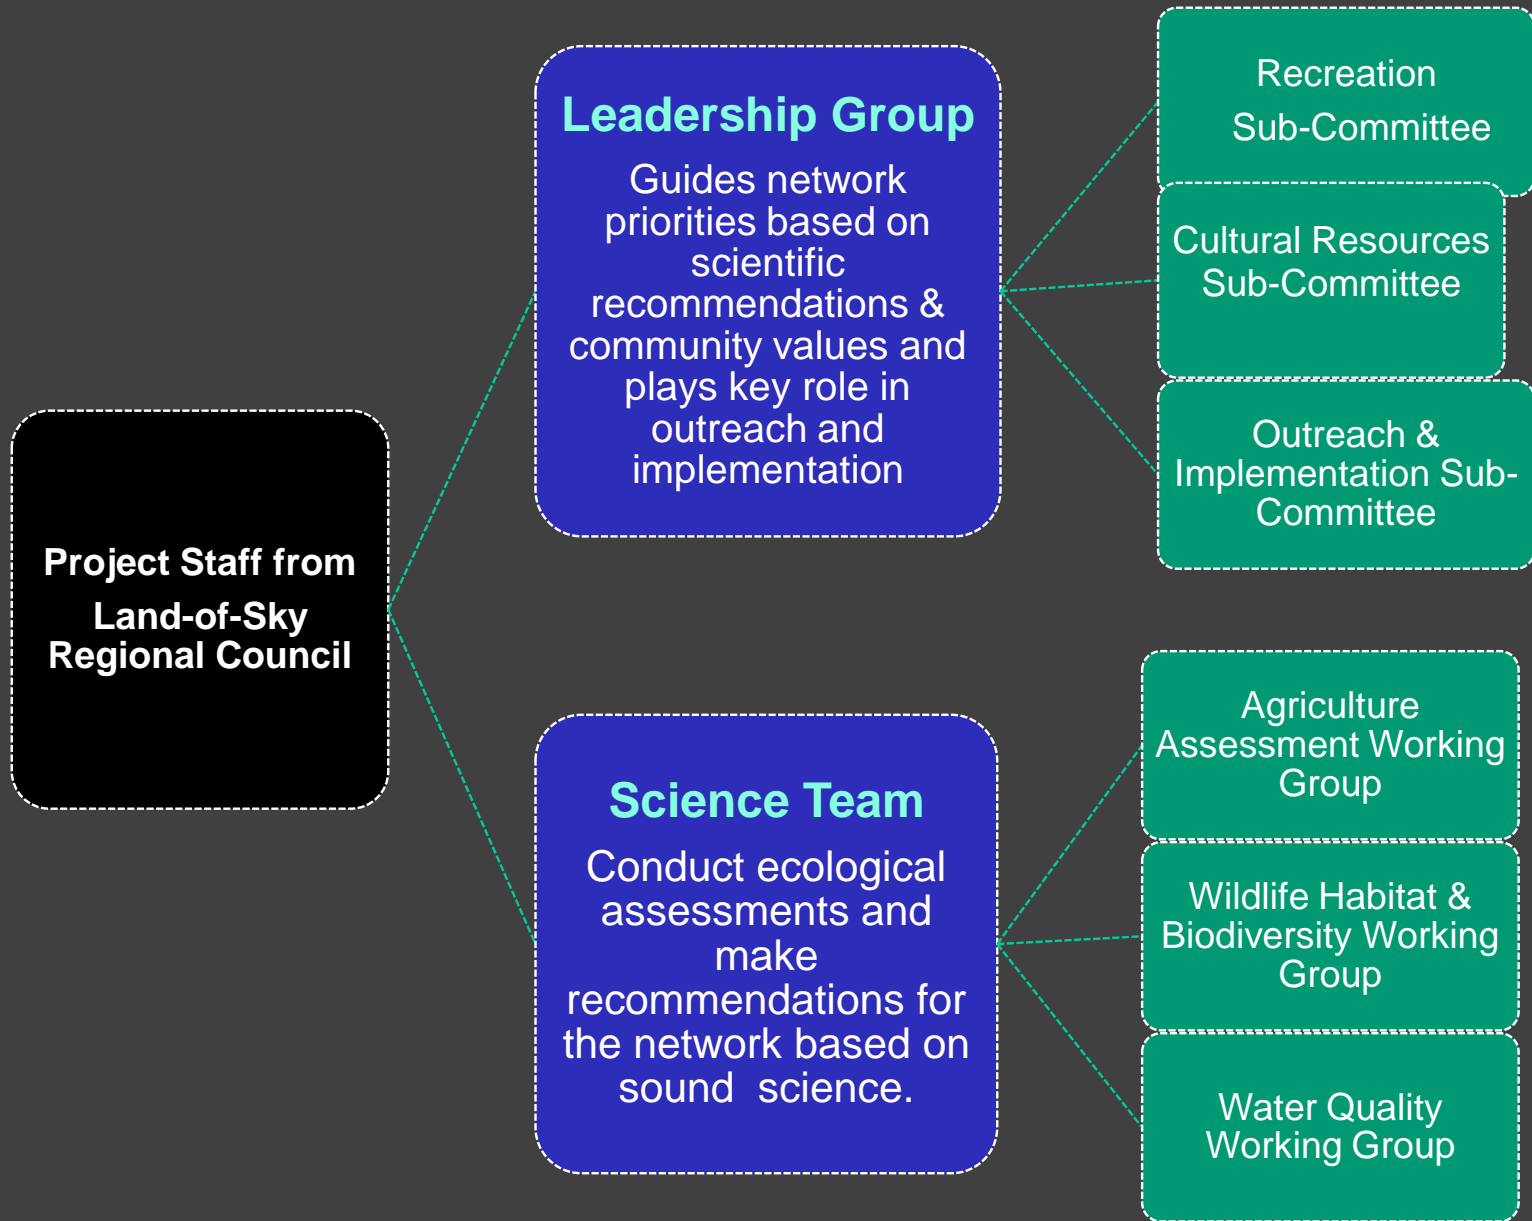

- **A Green Infrastructure Network may include:**
 - *Natural areas*
 - *Public and private conservation lands*
 - *Farmlands and lands managed for forestry*
 - *Outdoor recreation areas and trails*
 - *Cultural resources and sites*
- **Green Infrastructure networks exist at various scales (parcel, community, regional)**

What are the most valuable resources in the region?

- Water and water quality
- Farming and forestry
- Cultural heritage
- Scenic views
- Recreation
- Wildlife habitat and biodiversity

Resource Assessments

Water Quality

Which lands are valuable for their contribution to water quality?

Agriculture

Which lands are valuable for farming and forestry?

Wildlife Habitat & Biodiversity

Which lands are valuable for wildlife habitat and supporting & maintaining biodiversity?

The Green Infrastructure Network is developed by using the highest priority lands identified in these assessments

For each assessment:

Process for Conducting Ecological Assessments

Form Assessment Work Group and Develop Assessment Goals

Work groups comprised of scientists, researchers, specialists, and other interested individuals with expertise in related fields

Develop Conceptual Model

based on review of DENR Conservation Planning Tool and goals and values identified by the work group.

Identify and Gather Relevant Data

from a variety of national, state, county, local, sources

Develop Ranking System and Final Assessment

that assigns a value to lands based on their landscape attributes, the quality of data and expertise provided by work group members

Assessment Approach/Standards

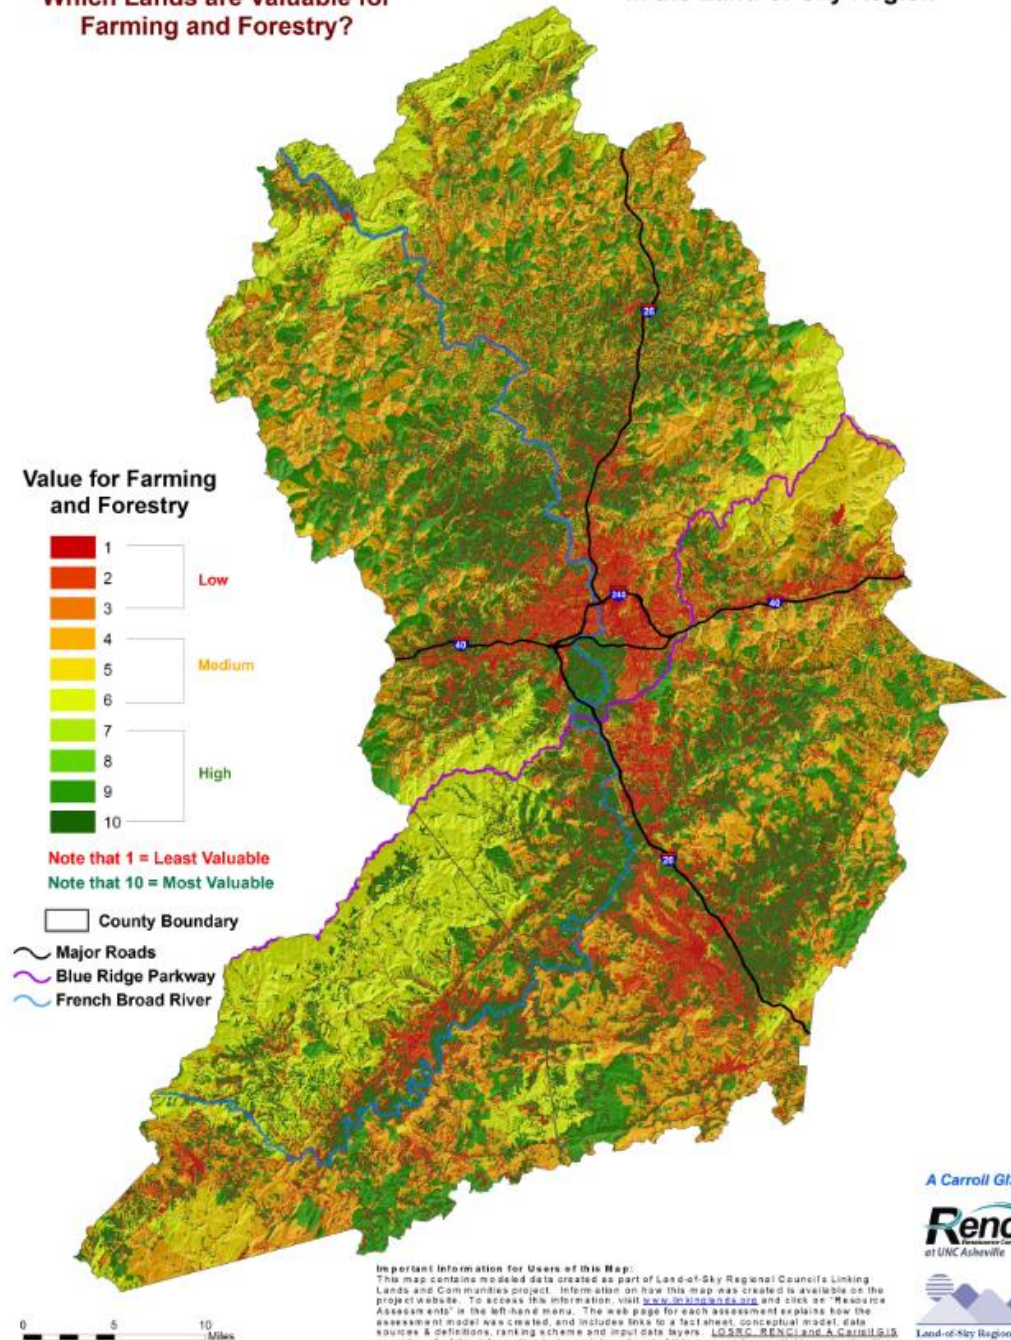

- Assessments and ranking criteria developed by each working group
- Raster based modeling (30-meter pixels)
- Ordinal ranking scale of 1 -10
- Use the most current and accurate data available
- Data incorporated must be region-wide

Primary Indicators of High Value Lands:

- Presence of an existing farm/forest operation
- Land Cover – Vegetation Type
- Most productive soils

Highest Ranking Lands (10) have productive soils AND have forest or cropland vegetation

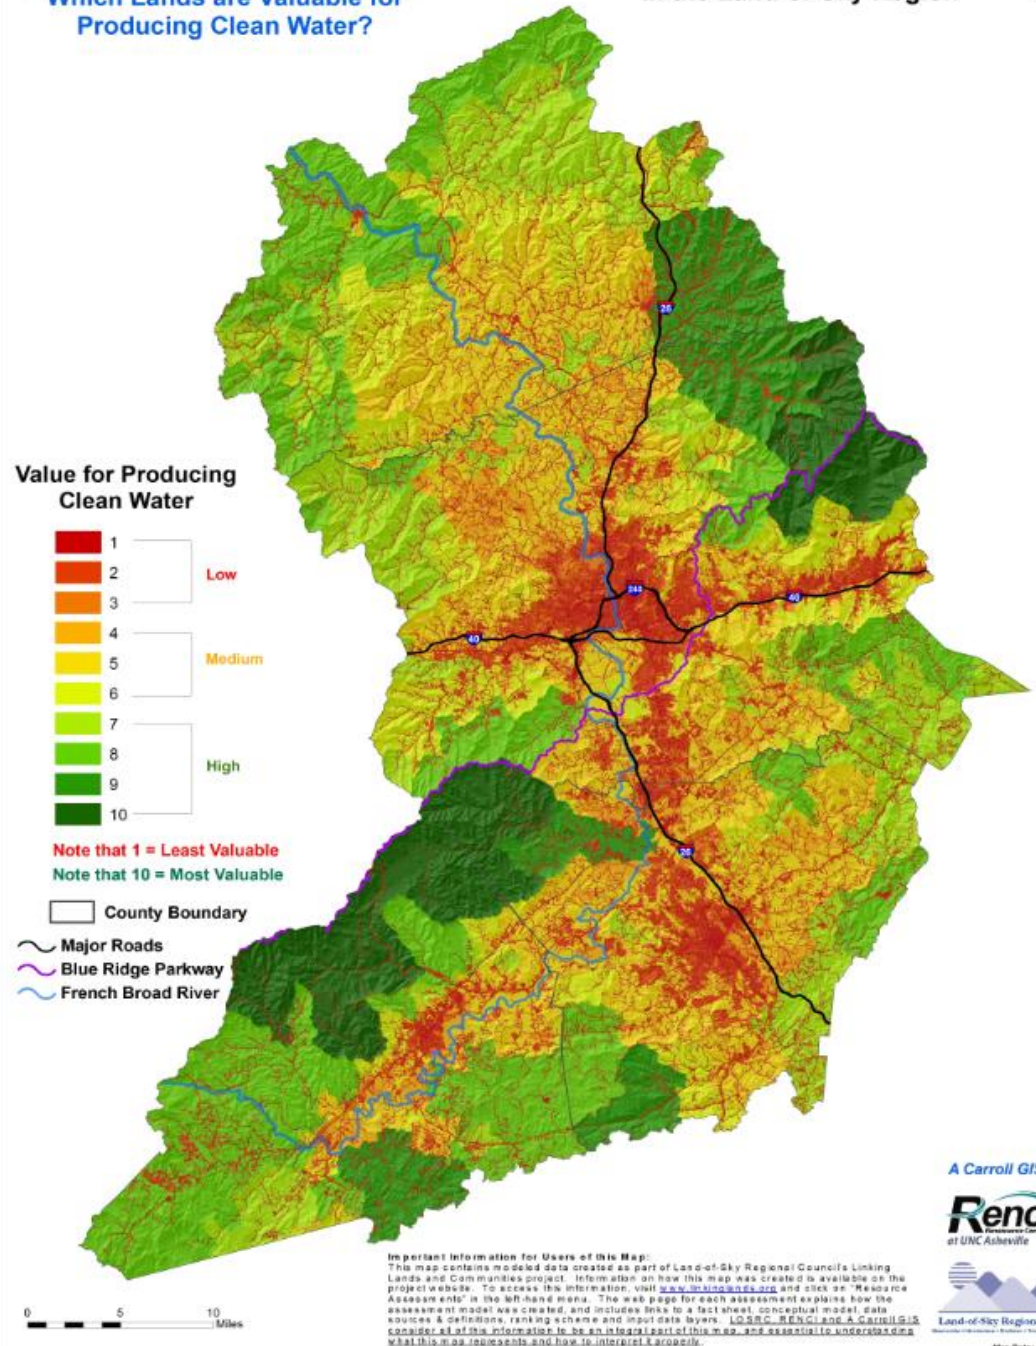

Primary Indicators of High Value Lands:

- Sub-watersheds that:
 - are primarily forested
 - have some level of protection
 - contains a water supply watershed
 - contain a stream rated good or excellent by DWQ

Water Quality Assessment Map

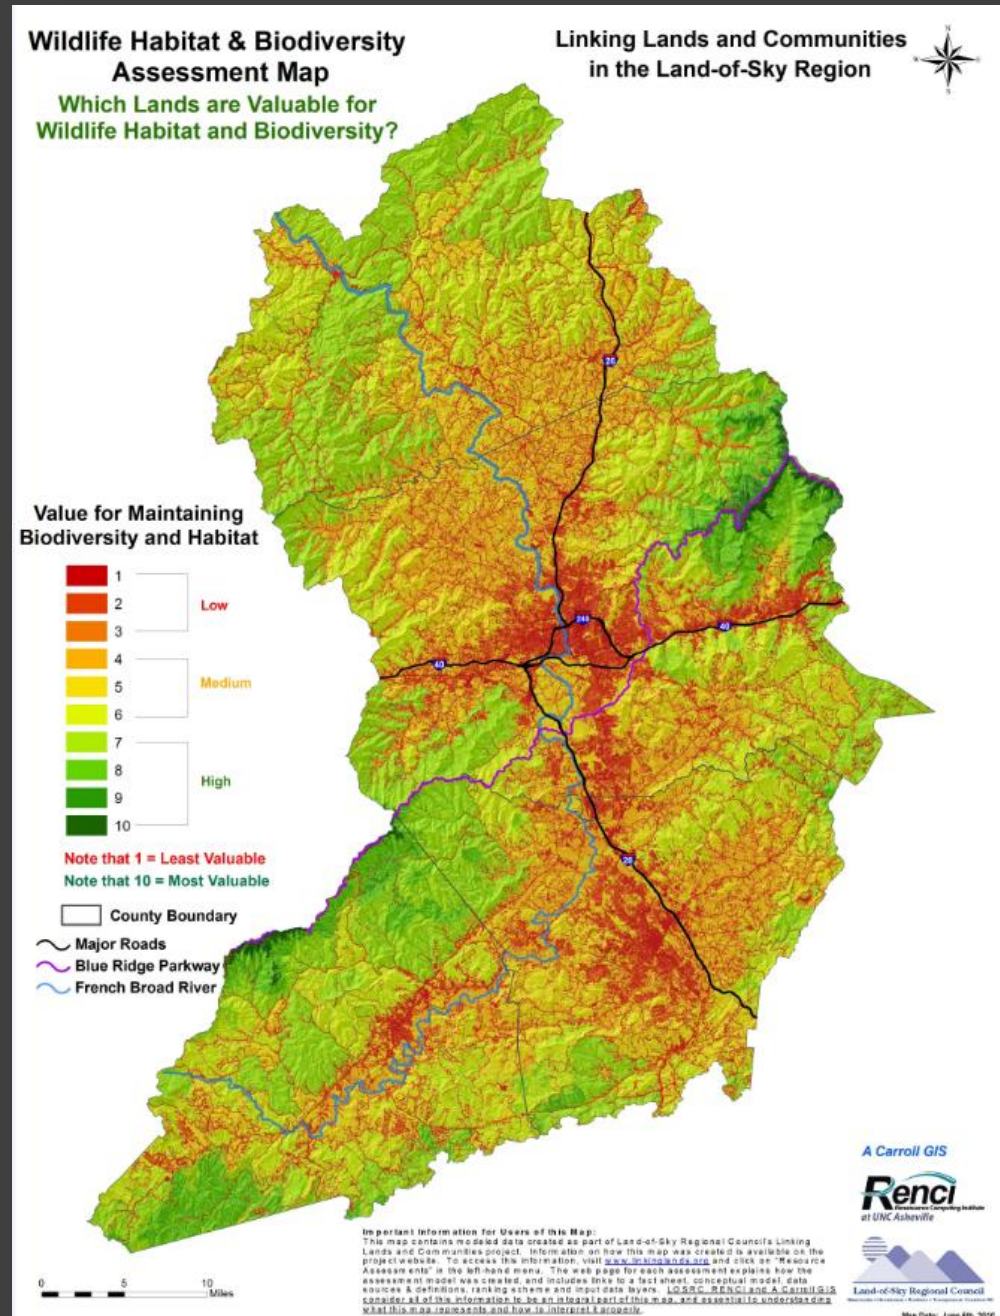

Which Lands are Valuable for Producing Clean Water?

Linking Lands and Communities in the Land-of-Sky Region

The WHB Assessment identifies lands that:

1. Provide large blocks of natural habitat
2. Support high levels of biodiversity
3. Support priority ecological systems as identified in the NC State Wildlife Action Plan developed by the Wildlife Resources Commission
4. Provide associated ecosystem services and functions to local communities.

Identifying Resource “Hubs”

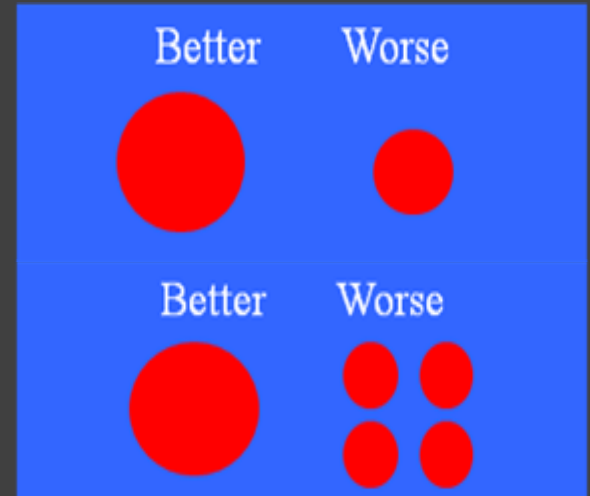

- Highest ranking lands (ranks 7-10)
- Minimum size criteria ≥ 100 acres
- Combined with public and protected lands

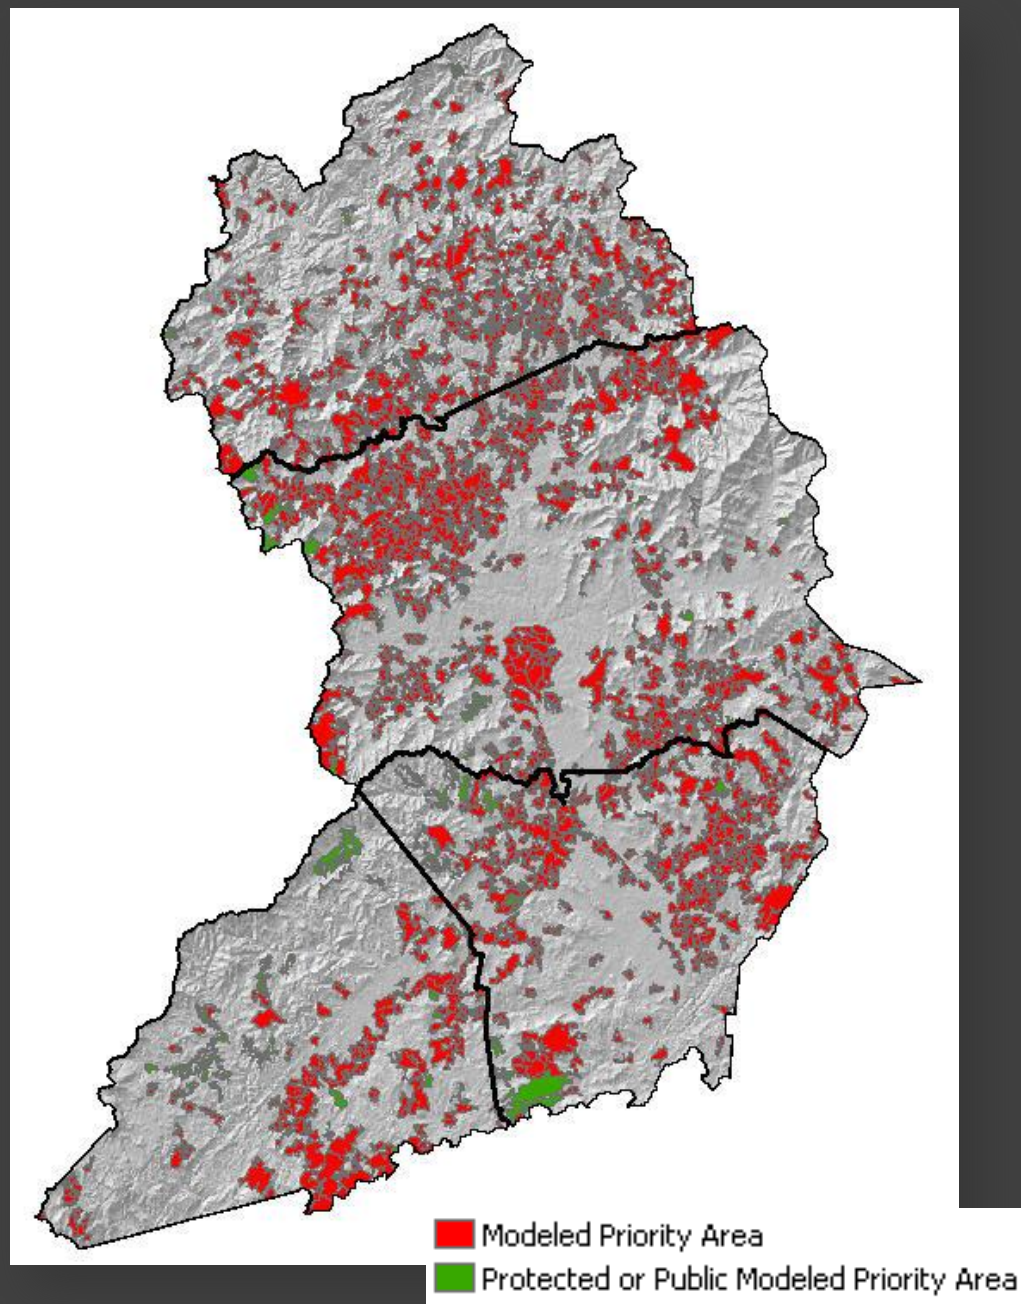

Network Design driven by Landscape Ecology Principles

- larger hubs are better than smaller hubs;
- one large hub is better than multiple smaller hubs with the same total area;
- more compact hubs are better than less compact hubs;
- connected hubs are better than isolated hubs.

A Carroll GIS

Map Date: June 17th, 2013

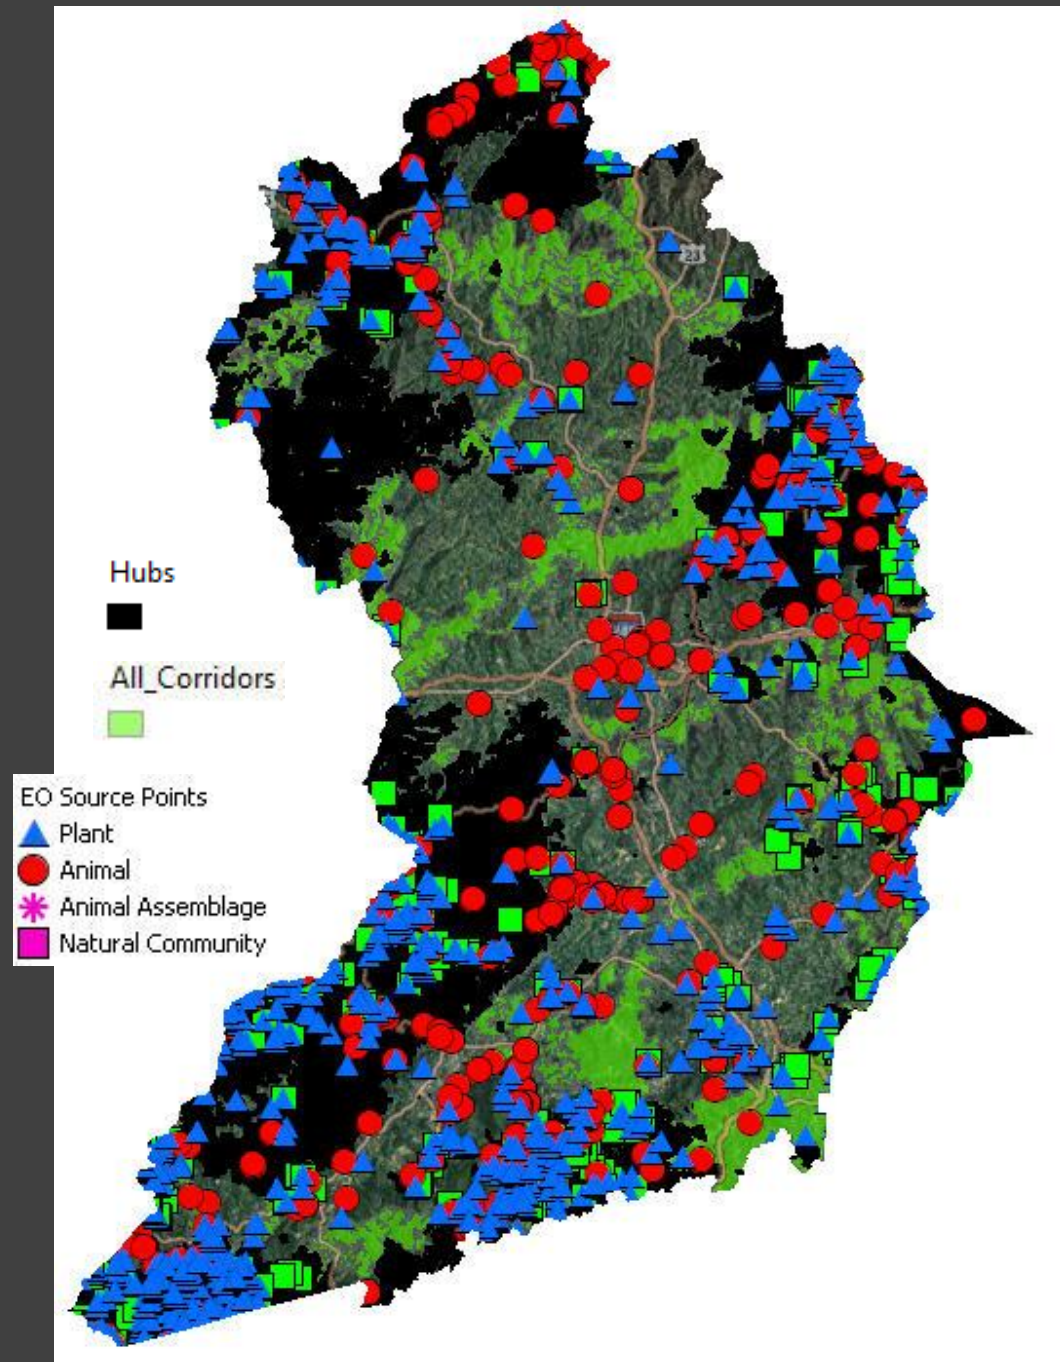

Hub and Corridor Evaluation: *Habitat Suites*

- Hubs and proposed corridors contain:
 - 91% of all natural habitat above 4,000 ft
 - 74% of all forested riparian habitat
 - 70% of all natural habitat below 4,000 ft
 - 25% of all agricultural and open space

Hub and Corridor Evaluation: *Natural Heritage Data*

- 74% of EO source points captured in WHBD hubs and corridors
- Fragmented or isolated populations represent remaining 26% of source points

Implementation / “Action”

- Series of actions that bring the GI network into reality on the ground and manage it in sustainable ways
 - Resource planning;
 - Conservation;
 - Restoration;
 - Development; and
 - Management

- Management practices key to implementation

Variety of Implementers

- Local Governments
- State and Federal Agencies
- Land Owners
- Developers
- Land Trusts
- Environmental and other Non-profits

Variety of actions – examples:

- A **county** uses the tools in its Comprehensive Plan update and/or its Development Review process
- **Developer** uses the tools to ID best orientation and layout for a planned subdivision
- **NCDOT** and **MPO** use the tools to mitigate negative impacts of intersection improvements upon wildlife crossings
- **NCDOT** and **MPO** use the tools to help identify best new alignment for a road
- **NC Wildlife Federation** works with a **developer** to facilitate a Wildlife-Friendly Development Certification
- A **greenways commission** uses the tools to plan a regional greenway
- A **land trust** uses the tools to prioritize key agricultural lands for protection
- The **USFS** uses the tools to make resource management decisions
- The **NCWRC** uses the tools to prioritize land management practices for a newly-acquired gamelands tract
- A **developer** uses the tools to gain regional credit for LEED certification of his/her project

Implementation Resources

Linking Lands and Communities Data, Maps, Information

State Government Resources

NC Div. of Community Assistance

County Planning and Permitting Offices

Local, Regional and Statewide Land Trusts

Studies, Toolkits, Best Management Practices

Quality Growth Toolbox

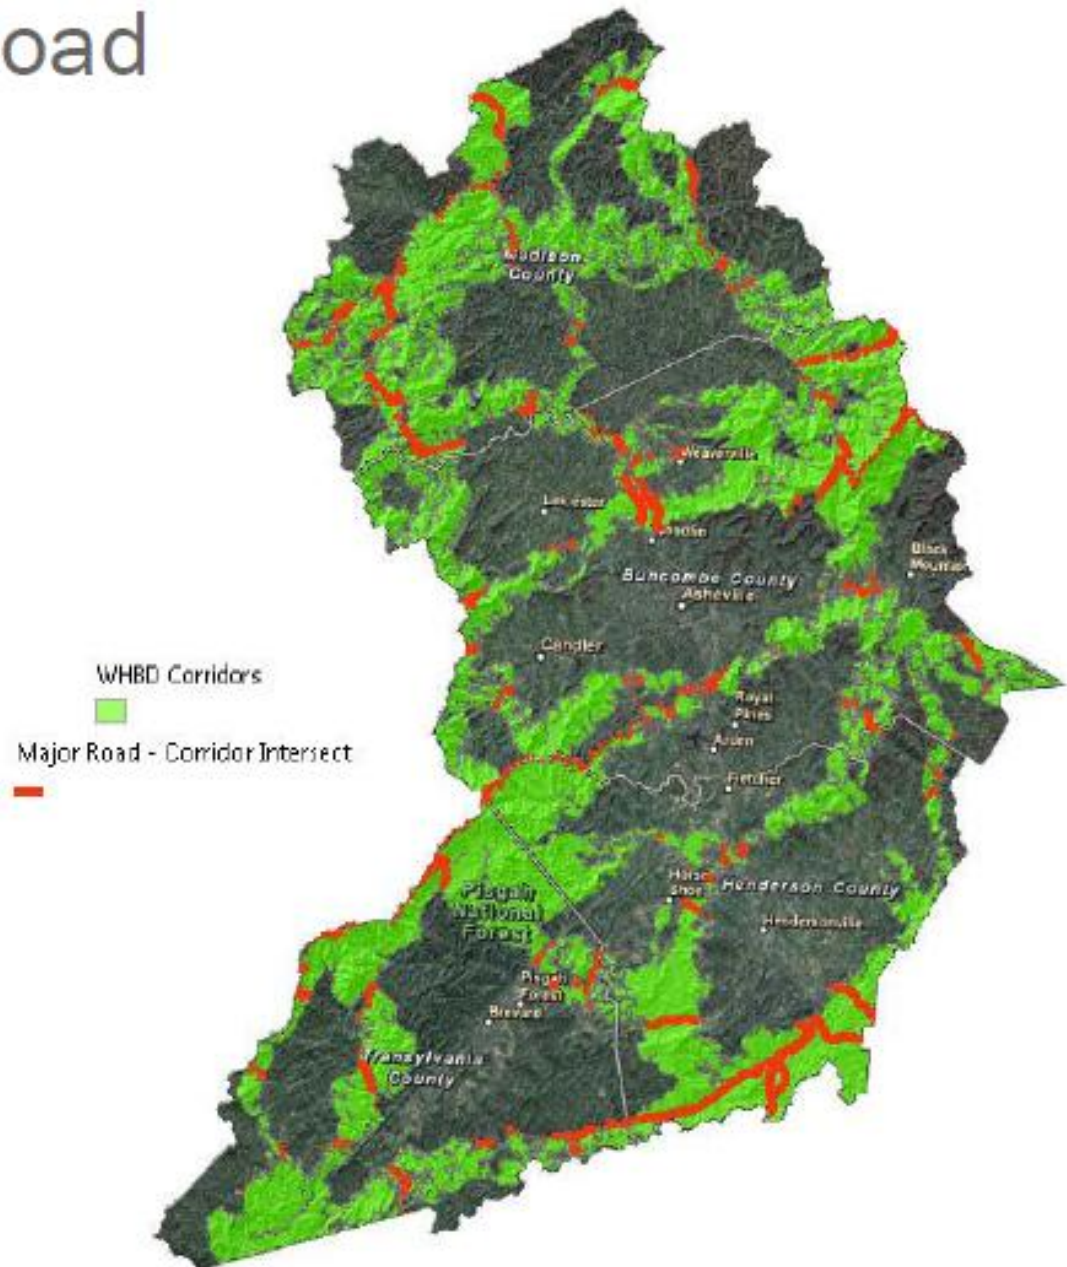

Mountain Landscapes Initiative

For Transportation Planning and Mitigation

Identifying Major Road Crossings

- Use intersect tool to ID major roads
- Culverts and bridges offer some movement
- Others represent barriers for connectivity among certain species

To Support City/County Planning

- Additional data, maps and tools to enhance current data and planning tools
- Provides additional information for planning for conservation, recreation and development

Structuring zoning and development ordinances to **conserve priority habitats alongside development**

- Minimum 25% of site must be in permanent conservation
 - *Priority on floodplains, stream buffers and slopes >30%*
- Density bonus – for greater open space OR agricultural preservation
- Must submit management plan

Development Review & Site Design

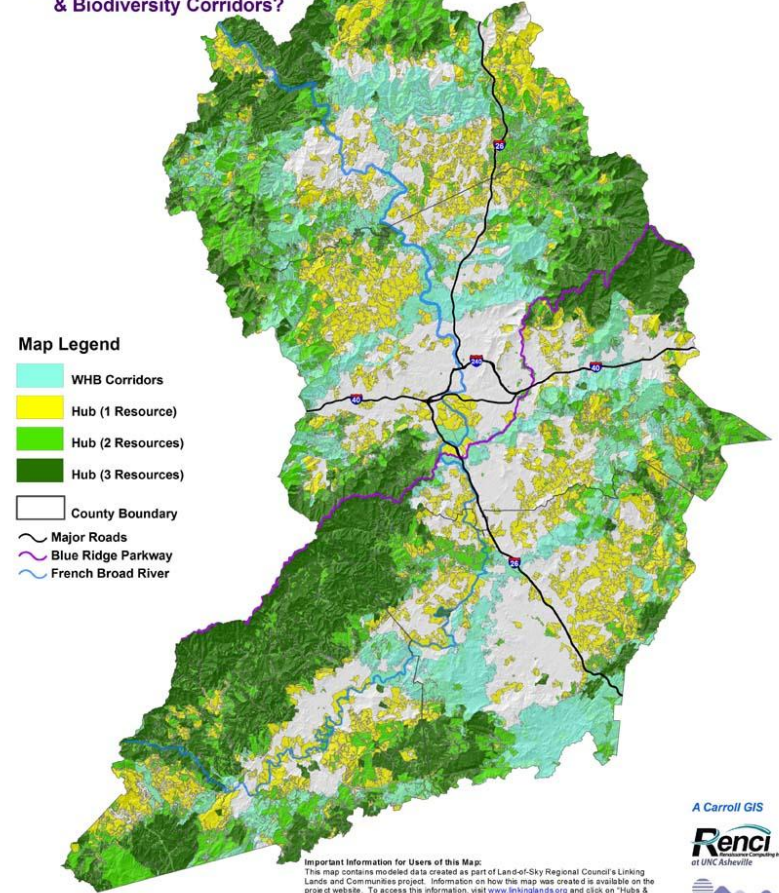

- Using the GI network, LLC assessments and other conservation data to review development proposals
- Applying wildlife-friendly development principles to site design

Development Review & Site Design

Green Infrastructure Network (Combined Resource Hubs)

Linking Lands and Communities in the Land-of-Sky Region

Member: The Mountain Community Foundation

Map Date: June 30, 2010

Communication & Outreach

- Provide informational materials and promote use of products – maps, documentation, website, “fact sheets”
- Presentations to a variety of groups
- Training workshops

Next steps

- Share project and process with other regions
- Update data as new data are available
- Design various development scenarios and compare development needs to natural resource priorities and needs
- Design regional climate change scenarios and examine impacts
- ID a set of best practices that increase resilience of resources, ecosystems

Questions? Discussion...
